

# Adapting to Change

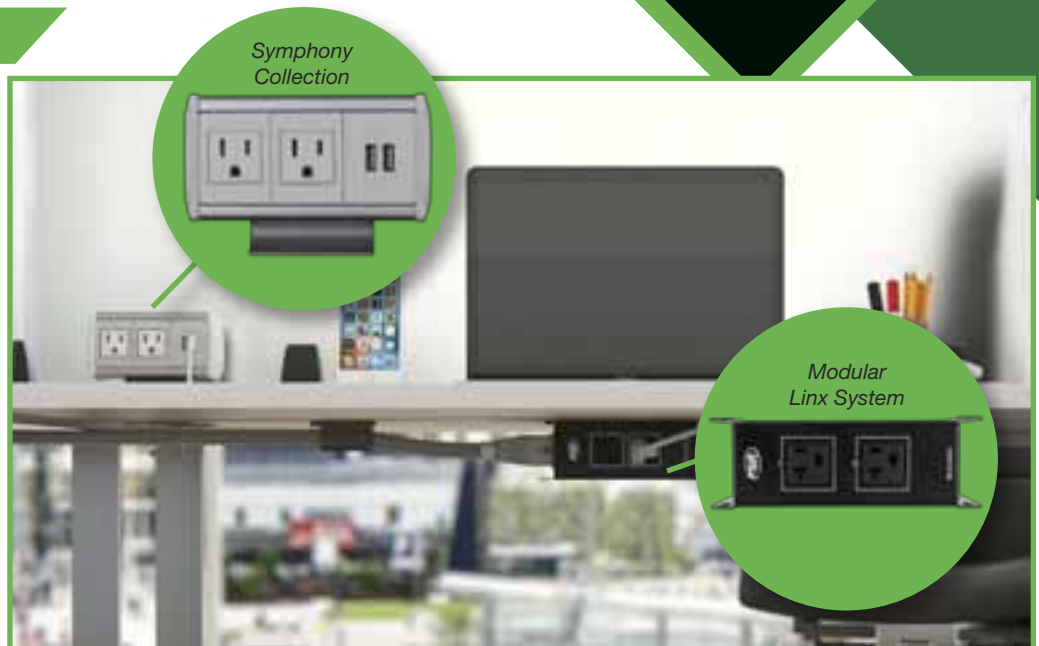

Reconfigurable power under your work surface

# MODULAR LINX SYSTEM

## An adaptable workplace

With today's constant change in the work space, the need for flexibility is more important than ever. Office work areas need the ability to be reconfigured quickly and cost-effectively. During this constant change, organizations will need places and products that can adapt quickly to where and how people work. Office Furnishings will need to move to allow areas to expand and contract as needed. At the same time, technology and the need to power and connect these devices are increasing.

Our Modular Linx System, Symphony Collection, and Smart-Way Raceway provide adaptable technology for a flexible workplace, giving team members easy access to power and data. All three products offer an organization the ability to reconfigure on the fly. The Modular Linx System is reconfigurable below the work surface, providing power when needed and can expand as you add more workstations. The system's interconnecting cables range from lengths 2'-8'. The Symphony Collection gives you power above the work surface, while our raceway gives you power and data from the floor.

## Adaptable Accessories

# MODULAR LINX SYSTEM

The MLS Tee provides a solution to make repositioning interconnecting cables to workstations effortless. When aligning workstations, a Tee cable can be inserted between any connecting cables. The Tee accessory can also be used between a connecting cable and the input or output of any distribution box. The Tee cable helps when realigning the desk to provide space between employees while still giving them easy access to power.

### Smart-Way Integration

FSR's Smart-Way Raceway can blend into your office interior or classroom with on- and in-floor options available in aluminum and slate grey. The FSR raceway can be extended as long or as short as your space requires. A female connector bracket installed in the furniture feed device box of the raceway gives it the ability to provide power to the Modular Linx System. With the Smart-Way Raceway, you're getting an ADA compliant and cost-effective way to get power across your office or classroom floor.
